

Week 2

Week of 1/1/2018 – 1/8/2018

This is our last week of work since the project is due on the 9th. This week we finished up our database entry which then started working a table which outputs the display of the database into the table. Also we matched the database information respective to their location on the Google Maps API. From there we implemented the MVC framework with the database. Which then leaves us to building the HTML site and designing the site with CSS. After that was done we created a form selector that allows the user to select which province or city they wish to view for the homicide rate.
